AGEING & PIGMENTATION

AFTER: DAY 50

What the patient said...

heard a lot of good things about the products, however was quite sceptical about the peels helping my pigmentation as I have used lots of products in the past to try and treat it, e.g. Dermal rollers, laser rejuvenation and LED therapy. I was conscious that the pigmentation and brownspots was making my skin look aged and leathery.

After my first chemical peel, I instantly saw the difference in my skin, the pigmentation started mottling on my forehead and I could visually see that the pigmentation was reducing. My skin felt hydrated and smoother. Lots of people had commented that my skin looked amazing especially people from work and asked me what I was doing differently. I am really glad I chose to be a part of this case study as I'm definitely seeing results and the peels are working.
